ABSTRACT

Worldwide, 2.5 million people became newly infected with HIV in 2011. In 2011, 1.7 million people died from AIDS-related causes worldwide. Further, in 2011, there were 34 million people living with HIV (UNAIDS, 2012). According to the population based surveys in low and middle income countries, only 24 per cent of young women and 36 per cent of young men responded correctly when asked five questions on HIV prevention and HIV transmission (UNAIDS, 2011). Thus, it is evident that main cause for the spread of HIV is lack of knowledge.

Effective sexuality education can provide young people with age-appropriate, culturally relevant and scientifically accurate information. Effective sexuality education is a vital part of HIV prevention and is also critical to achieving Universal Access targets for reproductive health and HIV prevention, treatment, care and support (UNAIDS, 2006).

A study was conducted to understand the knowledge and attitude of students aged 14-16 years studying in 8th, 9th and 10th standard. The study was conducted in nine-Districts of Karnataka State, India covering 1296 students. The findings indicate that the knowledge level is poor among the students and they have requested to include Sexuality Education in the school curricula.

Keywords: Young People, Sexuality Education, Joint United Nations Programme on HIV/AIDS (UNAIDS), Human immunodeficiency virus infection / acquired immunodeficiency syndrome (HIV/AIDS).

Adolescents, Young People and HIV

Worldwide, 2.5 million [2.2 million-2.8 million] people became newly infected with HIV in 2011. In 2011, 1.7 million [1.5 million-1.9 million] people died from AIDS-related causes worldwide. Further, in 2011, there were 34 million [31.4 million-35.9 million] people living with HIV (UNAIDS, 2012).
Today, there are 1.6 billion people aged 12-24, the largest generation of adolescents and young people ever! (SG Report, 2012). In 2010, young people aged 15-24 accounted for 42 per cent of new HIV infections in people aged 15 and older. Among young people living with HIV, nearly 80 per cent (4 million) live in Sub-Saharan Africa (UNAIDS, 2012). Globally, young women aged 15-24, have HIV infection rates twice as high as in young men, and account for 22 per cent of all new HIV infections and 31 per cent of new infections in Sub-Saharan Africa (UNAIDS, 2011). Further, many adolescents living with HIV were born with the virus (UNICEF, 2011). Thus, adolescents, young people and HIV are interconnected with each other.

Knowledge

According to the most recent population based surveys in low and middle income countries, only 24 per cent of young women and 36 per cent of young men responded correctly when asked five questions on HIV prevention and HIV transmission (UNAIDS, 2011). Thus, it is evident that main cause for the spread of HIV is lack of knowledge.

Gender Inequalities

In 2010, 12 per cent of the 135 million children born that year were born to women aged 15-19, and a further 32 per cent were born to women aged 20-24 (SG Report, 2012).

In some countries with high HIV prevalence, 30-50 per cent of girls give birth to their first child before their 19th birthday! (UNICEF, 2011).

It is estimated that, in the last decade, over 58 million girls were married before the age of 18 years; of which, 15 million were 10-14 years old. Many were married against their will, often experiencing violence (UNICEF, 2005). When girls have access to education, they are less likely to marry early (SG Report, 2012).

Gender-based Violence

Violence and the threat to violence hampers women’s, including young women’s and adolescents, ability to protect themselves from HIV infection and/or to make smart decisions regarding sexual health (UNAIDS, 2012).

The prevalence of forced first sex among adolescent girls younger than 15 years ranges between 11 per cent and 48 per cent globally (WHO, 2005).

Vulnerability of Key Populations

Adolescents who sell sex or use drugs are at higher risk of HIV infection. They also may not have access to information, sterile injecting equipment and services such as HIV testing and support (UNICEF, 2011).

Meeting the Challenge

At the 2006 United Nations High Level Meeting on AIDS, governments of the world committed “to ensure an HIV-free future generation through the implementation of comprehensive, evidence based prevention strategies, responsible sexual behavior, including use of condoms, evidence and skills-based youth specific HIV education, mass media interventions, and the provision of youth friendly health services (UNGASS, 2006).

Age-appropriate sexuality education can increase knowledge and contribute to more responsible sexual behavior. Around 50 per cent of such programmes evaluated in a 2006
review of 83 evaluations showed decreased sexual risk-taking among participants (UNICEF, 2011).

In many countries, sexual activity is initiated in early adolescence, before age 15 (SG Report, 2012). As evidence shows that sexual activity among young people is a reality, there is a need to take action to empower them to make responsible and informed decisions in regards to sexual and reproductive health, HIV and gender equality, as well as addressing gender-based violence (SG Report, 2012).

Programmes to prevent HIV infections among young people will be more effective if they include combination prevention approaches that are youth-friendly, and promote comprehensive services that include sexuality education, knowledge of HIV, access to sexual and reproductive health services, and discussion on harmful sexual norms and practices (UNAIDS, 2010).

**Formulation of the Problem**

Young people face increasing pressures regarding sex and sexuality including conflicting messages and norms. On the one hand, sex is seen as negative and associated with guilt, fear and disease, but through the media and friends, it is portrayed as positive and desirable. Such pressures may be perpetuated by a lack of accurate information, skills, and awareness of their rights and by gender expectations.

Knowledge about HIV transmission remains low in many countries, with women generally less well informed than men. According to UNAIDS (UNAIDS, 2008), many young people still lack accurate, complete information on how to avoid exposure to HIV. Survey data from 64 countries indicate that only 40 per cent of males and 38 per cent of females aged 15 to 24 had accurate and comprehensive knowledge about HIV and its prevention (UNAIDS, 2008).

We have choice to make: leave children to find their own way through the clouds of partial information, misinformation and outright exploitation that they will find from media, the internet, peers and the unscrupulous, or instead face up to the challenge of providing clear, well informed, and scientifically-grounded sexuality education based in the universal values of respect and human rights.

**What Is Sexuality Education?**

Sexuality Education is defined as an age-appropriate, culturally relevant approach to teaching about sex and relationships by providing scientifically accurate, realistic, non-judgmental information. Sexuality education provides opportunities to explore one’s own values and attitudes and to build decision-making, communication and risk reduction skills about many aspects of sexuality (UNESCO 2009).

Effective sexuality education is a vital part of HIV prevention and is also critical to achieving Universal Access targets for reproductive health and HIV prevention, treatment, care and support (UNAIDS, 2006). Comprehensive sexuality education can radically shift the trajectory of the HIV epidemic, and young people are clear in their demand for more – and better – sexuality education, services and resources to meet their prevention needs.

Thus, the awareness about comprehensive sexuality education has to be implemented in schools. But for the success of any education, the knowledge and attitude of the students has to be ascertained. In this backdrop, the problem formulated for the present study was to
understand the knowledge and attitude among students for introducing sexuality education in secondary schools.

**AIM OF THE STUDY**

The study aimed at understanding the knowledge and attitude of students on sexuality education in secondary schools.

**SPECIFIC OBJECTIVES OF THE STUDY**

In pursuance of the aim of the study, some of the specific objectives that were set for the study included:

- To study the knowledge about sexuality education among students.
- To study the attitude of students towards introducing sexuality education in schools.
- To know whether imparting sexuality education in secondary schools is required or not. If yes, what should be the content/curriculum and who should deliver to the students.
- To suggest measures on the basis of the findings of the study, to improve the awareness among students on sexuality education.

**RESEARCH METHODOLOGY**

Effective sexuality education can provide young people with age-appropriate, culturally relevant and scientifically accurate information. It includes structured opportunities for young people to explore their attitudes and values, and to practice the decision-making and other life skills they will need to be able to make informed choices about their sexual lives.

The present study was undertaken to understand the knowledge and attitude of parents, teachers and students towards introducing sexuality education in secondary schools.

The place chosen for the present study was nine-Districts in Karnataka State namely Bangalore Rural, Tumkur, Dharwad, Gadag, Bidar, Gulbarga, Chamarajanagar, Mysore and Dakshina Kannada. Students of secondary schools in the age group of 13-17 years studying from 8th to 10th standard constituted the study group or the universe. Multi-stage random sampling method is adopted in this study. Details of sample design is furnished in Table 1.

A descriptive diagnostic design was adopted to study the knowledge and attitude of students towards introducing sexuality education in schools. Questionnaire was prepared by the researcher with inputs from subject experts to obtain the students’ baseline information like
District, Government or Private School, Co-Education or Exclusively Girls’ School and Gender. Broadly, the questionnaire consisted “Knowledge” and “Attitude” related questions. Knowledge related questions covered aspects related to [i] Relationships, [ii] Values, attitude and skills, [iii] Culture, society and human rights, [iv] Human development and [v] Sexual and reproductive health. Attitude questions related to introducing sexuality education were also included. In total, there were 31 questions related to knowledge and 10 attitude related questions.

In total, the study covered 1296 students. Data pertaining to sexuality education related to relationships, values, attitude and skills, culture, society and human rights, human development, sexual and reproductive health were gathered. The data obtained was analyzed using statistical analysis. Student’s ‘t’ test, Chi-Square Test, Analysis of Variance and Co-efficient of Correlation were employed to find out the statistical significance between male and female respondents among the students.

**FINDINGS OF THE STUDY**

**Knowledge about Relationships**

- Students were asked on their knowledge about friendship, love and romantic relationships. Among the total students (n=1296), 83.6 per cent of the students mentioned that they are not aware about friendship, love and romantic relationships and only 16.4 per cent knew about the same.

- Among the male students, only 16.9 per cent knew about friendship, love and romantic relationships and only 16.2 per cent female students were aware of the same. However, female students have inclined less about friendship, love and romantic relationships with P=0.750. Details are furnished in Table 2.

<td>213 16.4</td>
<td>73 16.9</td>
<td>140 16.2</td>
<td>P=0.750</td>
</tr>
</tbody>
</table>

**Knowledge about Tolerance and Respect**

- Students were asked about their knowledge on tolerance and respect. Majority (83.6%) of the students mentioned that they are not aware about tolerance and respect issues, whereas, only 16.4 per cent knew about the same.

- Among the male respondents, 16.9 per cent of them had awareness about tolerance and respect and 16.2 per cent of females had knowledge about the same. However, female teachers have inclined less about tolerance and respect with P=0.750 (Table 3).
Knowledge About Norms and Peer Influence on Sexual Behaviour

- Attempt was made to understand whether the students are aware about norms and peer influence on sexual behaviour. About 60.8 per cent of the students were not aware, whereas 39.2 per cent were aware about norms and peer influence on sexual behaviour.

- Among the male students, 41.4 per cent were aware and 38.1 per cent of female students expressed that they have knowledge about norms and peer influence on sexual behaviour. However, female students have inclined less towards norms and peer influence on sexual behaviour with $P=0.243$ (Table 4).

Knowledge About Communication, Refusal and Negotiation Skills

- Communication, refusal and negotiation skills form an important part in understanding values, attitude and skills about sexuality education. Among the total students ($n=1296$), about 46.8 per cent mentioned that they know about communication, refusal and negotiation skills. More than half (53.2%) did not know about the same.

- Among the male students, 48.1 per cent and 46.2 per cent female students mentioned that they know about communication, refusal and negotiation skills. However, female students have inclined less towards communication, refusal and negotiation skills with $P=0.503$ (Table 5).
Knowledge about Life Skills

- Among the total students (n=1296), 43.5 per cent stated that they did not have awareness about life skills. Whereas, 56.5 per cent mentioned that they had knowledge about the same.

- About 58.3 per cent males and 55.6 per cent female students expressed that they had knowledge about life skills. Compared to the males, female students had less inclination towards knowledge about life skills with \( P=0.342 \) (Table 6).

Knowledge about Sex, Sexuality and Gender

- From the total students (n=1296), majority (65.7%) mentioned that they were not aware about sex, sexuality and gender. Meanwhile, nearly one-third (34.3%) had knowledge about the same.

- About 37.3 per cent males and 32.8 per cent females expressed that they had knowledge about sex, sexuality and gender. Compared to the males, female students showed less inclination about sex, sexuality and gender with \( P=0.106 \) (Table 7).

Knowledge about Sexual and Reproductive Anatomy

- Among the total students (n=1296), 50.8 per cent stated that they did not have awareness about sexual and reproductive anatomy. Whereas, 49.2 per cent of them expressed that they have knowledge about the same.

- About 48.6 per cent males and 49.4 per cent female students mentioned that they had knowledge about sexual and reproductive anatomy. Compared to the females, male students had less inclination about sexual and reproductive anatomy with \( P=0.783 \) (Table 8).

**Summary of Knowledge and Attitude Questionnaire**

- In knowledge questions, percentage of mean score to maximum score is 56.72 per cent. This indicates that students do not have good knowledge and understanding about sexuality education. Hence, students need to be taught on sexuality education in schools.

- In attitude related questions, percentage of mean score to maximum score is 67.5 percent. This indicates that there is a need to develop the attitude of students towards sexuality education.

**Opinion of Students on Introduction of Sexuality Education**

- Among the total students (n=1296), majority (82.2%) stated that there is a need to teach sexuality education in schools.

- Among the total students (n=1296), majority (77.1%) stated that sexuality education must be part of the curriculum.

- Among the total respondents (n=1296), more than half (59.5%) of the students mentioned that teachers will give the right information about sexuality education, followed by parents (31.0%) and friends (9.5%).

**SUGGESTIONS**

Age-appropriate sexuality education needs to be imparted in the schools.

**Content**

As evidence shows that sexual activity among young people is a reality, there is a need to take action to empower them to make responsible and informed decisions with regard to sexual and reproductive health, HIV and gender equality, as well as addressing gender-based violence. For this, while introducing Sexuality Education in schools, the learning objectives should cover the following four components in the learning process:

**Information:** Sexuality education should provide accurate information about human sexuality including growth and development, sexual anatomy and physiology, reproduction, contraception, pregnancy and child birth, HIV and AIDS, Sexually Transmitted Diseases (STIs), family life and interpersonal relationships, culture and sexuality, human rights.
empowerment, non-discrimination, equality and gender roles, sexual abuse and gender-based violence.

**Values, Attitude and Social Norms:** Sexuality education should offer students opportunities to explore values, attitudes and norms (personal, family, peer and community) in relation to sexual behavior, health, risk-taking and decision-making and in consideration of the principles of tolerance, respect, gender equality, human rights and equality.

**Interpersonal and Relationship Skills:** Sexuality education should promote the acquisition of skills in relation to decision making, assertiveness, communication, negotiation and refusal. Such skills can contribute to better and more productive relationships with family members, peers and friends.

**Responsibility:** Sexuality education should encourage students to assume responsibility for their own behavior as well as their behavior towards other people through respect, acceptance, tolerance and empathy for all people regardless of their health status or sexual orientation.

**Training to Teachers**

- Curriculum to be delivered by trained teachers
- Pre-service training at teacher training institutions and in-service and refresher training for classroom teachers to be provided to build their comfort and confidence.
- Develop skills of teachers in participatory and active learning.

**Parental Involvement**

- Co-operation and support of parents, families and other community stakeholders should be sought.

**Social Work Interventions**

- Teachers need to be aware of the biological needs, social needs, cultural needs and psychological needs of the students.
- Provide Social work services to students - curative, correctional, rehabilitative, preventive and developmental.
- Social Work knowledge base can be practiced by teachers at individual, group and community levels for enhancing the knowledge and attitude of students and parents on sexuality education.
- Teachers need to be trained in techniques of Social Work like interviewing, counseling techniques, communication, listening, observation, questioning, supporting, educating, agreeing, disagreeing, reviewing and reinforcing.

**CONCLUSION**

The education sector has a critical role to play in preparing children and young people for their adult roles and responsibilities (Delors et al., 1996); the transition to adulthood required becoming informed and equipped with the appropriate knowledge and skills to make responsible choices in their social and sexual lives. In most countries, children between the age of five and thirteen, in particular, spend relatively large amounts of time in school. Thus,
schools provide a practical means of reaching large numbers of young people from diverse backgrounds in ways that are replicable and sustainable (Gordon, 2008).

The present study indicates that the students have less awareness pertaining to sexuality education. Thus, they are more prone towards HIV/AIDS. It is important to note that they have the inclination to learn sexuality education. Of course, parents and teachers also play a vital role in shaping them. Parents need to be able to address the physical and behavioral aspects of human sexuality with their children, and children need to be informed and equipped with the knowledge and skills to make responsible decisions about sexuality, relationships, HIV and other sexually transmitted infections. This can be possible only when age-appropriate sexuality education is imparted by trained teacher.
